

Patient Intake Report

Patient: Aisha Rahman **Age:** 45 **Sex:** F **Date:** 2026-07-21

Chief Complaint

Worsening abdominal pain for 2 days, plus a persistent dry cough for 3 weeks.

History of Present Illness

Patient reports dull, cramping right-upper-quadrant abdominal pain for two days, worse after eating fatty foods, associated with nausea and one episode of vomiting. Separately, she describes a dry, non-productive cough for the past three weeks, worse at night, with mild intermittent wheeze, no hemoptysis, no fever. Denies recent travel. Non-smoker.

Relevant Medical History

History of gallstones noted on prior ultrasound 2 years ago, managed conservatively. Mild asthma diagnosed in childhood, currently not on daily controller medication.

Vitals

BP 128/82, HR 88, RR 18, SpO2 97% on room air, temp 37.4C.

Physical Exam Notes

Abdomen: mild tenderness in right upper quadrant, positive Murphy's sign, no rebound or guarding.
Lungs: mild expiratory wheeze bilaterally, no crackles. No cyanosis.
